Task-specific procedures and feedback

Forecasting and prediction

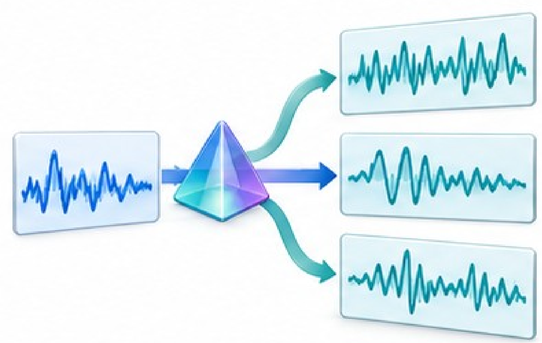

History + context

Select model → predict → revise

Evaluate: Forecast error / calibration

Data augmentation and synthesis

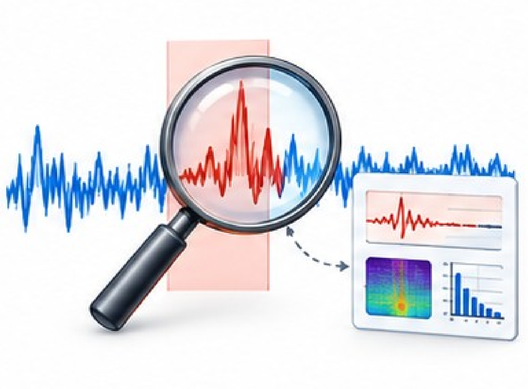

Samples + task requirements

Generate → review → train learner

Evaluate: Fidelity / downstream learning

Anomaly detection and diagnosis

Series + supporting evidence

Detect → diagnose → refine intervals

Evaluate: Detection / diagnosis quality

Decision support

State + forecast + constraints

Compare actions → act → update

Evaluate: Action utility / risk / latency

The target artifact determines the feedback and acceptance criterion
