

How a Time-Series Agent is constructed

The LLM side is independent; Harness modules form a nested stack and are recorded at the module level.

The nesting expresses reuse: General Harness $\supset$ General Time-Series Harness $\supset$ Task-Specific Harness.

Paper Card

claim · evidence locator · module layer · task family · BibTeX · evaluation · review status

The card is the unit of evidence. One paper may contribute several modules, while each module receives its deepest applicable Harness label.
